Dissertation: The Logic of Indexicals

Pure indexicals, words like “I” and “today”, are among the few kinds of words whose semantics, at least for their most basic uses, is widely thought to be settled. In spite of their ability to change their referent when placed in different contexts, it has always been assumed that any logic of indexicals will require that every argument take place in just one context, with just one speaker, in one moment, and in one place. This is undesirable, because we do cooperate when we argue, and we move about in time and space when we do so. In my dissertation, I present a logic which allows contexts to change within an argument. I then argue the notion of validity it develops is the right one, in spite of it being radically different from customary notions of validity. I also propose a new way to distinguish between pure indexicals and true demonstratives, like “this” and “that”. The new distinction shines a new light on the vexing problem of developing a logic of true demonstratives.
